DETAILED ACTION

1. This action is responsive to communications: Amendment filed on 12/09/2003

2. Claims 1-19 are pending in this case. Claims 1, 9, 15, and 19 are independent

claims. Claim 19 is a new claim that has been added.

3. The rejection of claims 1-6, 15-16, and 18 based on 35 U.S.C. 102(e) has been

withdrawn.

4. The rejection of claims 7-14, and 17 based on 35 U.S.C. 103(a) has been

withdrawn.

Claim Objections

5. The objection placed on claims 16-18 has been withdrawn in light of corrections made.

Claim Rejections - 35 USC § 102

6. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical

Application/Control Number: 09/550,348

Art Unit: 2178

Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000. Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

7. Claims 1-6, 15-16, and 18-19 are rejected under 35 U.S.C. 102(e) as being anticipated by Light et al. (hereinafter Light, US Patent Number 6,192,380, filed on March 31, 1998).

Regarding independent claim 1, Light discloses a method in which a form recognition unit detects properties about a form and a website containing a form (column 2, line 63-column 3, line 47 of Light). A matching unit then decides what data should be place in the form and at what locations, at which point the data and instructions on what to do with it (job order) is sent to the fill-in unit (column 3, line 48-column 4, line 30 of Light). The fill-in unit then submits the data into the form and ultimately submits the form to the host (column 3, line 48-column 4, line 30 of Light). Then, any new form information necessary for the site is added to the database containing a user's form data (column 4, lines 5-36 of Light).

Regarding dependent claims 2-4, Light discloses a method in which forms are found on web pages on the Web (Internet) (column 1, lines 7-40 of Light).

Regarding dependent claim 5, Light discloses a method in which forms are filled out with information such as credit card numbers to pay for a service (Figure 6 and column 3, lines 5-59 of Light).

Regarding dependent claim 6, Light discloses a method in which the form-filling process is completely controlled by a single networked system (server) (Figure 3 and column 2, line 53-column 3, line 47 of Light).

Regarding independent claim 15, the claim incorporates substantially similar subject matter as claim 1. Thus the claim is rejected along the same rationale as claim 1.

Regarding dependent claim 16, the claim incorporates substantially similar subject matter as claims 2-4. Thus, the claim is rejected along the same rationale as claims 2-4.

Regarding dependent claim 18, Light discloses a method in which the system stores new form information obtained from a site once the form filling process is complete (column 4, lines 5-36 of Light).

Regarding independent claim 19, Light discloses a method in which a form recognition unit detects properties about a form and a website containing a form (column 2, line 63-column 3, line 47 of Light). A matching unit then decides what data should be place in the form and at what locations, at which point the data and instructions on what to do with it (job order) is sent to the fill-in unit (column 3, line 48-column 4, line 30 of Light). The fill-in unit then submits the data into the form and ultimately submits the form to the host (column 3, line 48-column 4, line 30 of Light). Then, any new form information necessary for the site is added to the database containing a user's form data (column 4, lines 5-36 of Light). Light discloses a method

in which the system stores new form information obtained from a site once the form filling process is complete (column 4, lines 5-36 of Light).

Claim Rejections - 35 USC § 103

- 8. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.
- 9. Claim 7, 9-12, and 14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Light et al. (hereinafter Light, US Patent Number 6,192,380, filed March 31, 1998) as applied to claims 1 and 3 above, and further in view of Jacobs et al. (US Patent Number 5,611,048, issued on March 11, 1997).

Regarding dependent claim 7, Light does not disclose a method of distributing software functions over a plurality of server nodes. However, Jacobs et al. discloses that functions to be performed on a server can be divided across multiple servers (column 4, lines 9-17 of Jacobs et al.). It would have been obvious to one of ordinary skill in the art at the time the invention was made to have combined the method of Light with the method of Jacobs et al. because it would have optimized the efficiency of the method of Light

Regarding independent claim 9, Light discloses a method in which a form recognition unit detects properties about a form and a website containing a form (column 2, line 63-column 3, line 47 of Light). A matching unit then decides what data

Page 6

should be place in the form and at what locations, at which point the data and instructions on what to do with it (job order) is sent to the fill-in unit (column 3, line 48-column 4, line 30 of Light). The fill-in unit then submits the data into the form and ultimately submits the form to the host (column 3, line 48-column 4, line 30 of Light). Then, any new form information necessary for the site is added to the database containing a user's form data (column 4, lines 5-36 of Light). Light does not disclose a method of performing the functions using a server for each function.

However, Jacobs et al. discloses that functions to be performed on a server can be divided across multiple servers (column 4, lines 9-17 of Jacobs et al.). It would have been obvious to one of ordinary skill in the art at the time the invention was made to have combined the method of Light with the method of Jacobs et al. because it would have optimized the efficiency of the method of Light

Regarding dependent claims 10-12, the claims incorporate similar subject matter as claims 2-4. Thus, the claims are rejected along the same rationale as claims 2-4.

Regarding dependent claim 14, Light does not disclose a method of distributing software functions over a plurality of server nodes, which are connected to each other via a dedicated data network. However, Jacobs et al. discloses that functions to be performed on a server can be divided across multiple servers that are connected to eachother via a local area network (column 4, lines 9-17 of Jacobs et al.). It would have been obvious to one of ordinary skill in the art at the time the invention was made to

Art Unit: 2178

have combined the method of Light with the method of Jacobs et al. because it would have optimized the efficiency of the method of Light

10. Claims 8, 13, and 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Light et al. (hereinafter Light, US Patent Number 6,192,380, filed March 31, 1998) as applied to claims 1, 3, 9, 10, and 15 above, and further in view of Kraft et al. (US Patent Number 6,084,585, with US filing date of December 5, 1997).

Regarding dependent claims 8, 13, and 17, Light does not disclose a method in which the job order is written in XML. However, Kraft et al. discloses that executable instructions which can be thought of as job orders can be written in any programming language including XML (column 3, lines 35-40 of Kraft et al.). It would have been obvious to one of ordinary skill in the art at the time the invention was made to have combined the method of Light with the method of Kraft et al. because the use of different programming languages was interchangeable.

Response to Arguments

11. Applicant's arguments with respect to claims 1-18 filed on 12/09/2003 have been considered but are most in view of the new ground(s) of rejection shown above.

Conclusion

12. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
